##Challenges

- Implementing authentication, possibly including facial recognition
- Using webRTC requires manually enabling camera and microphone access; we need to figure out how to make this process as easy as possible.
- For robustness, we should add a UI-friendly way to allow user to switch between multiple potential cameras and mics in case one or more are not functional or preferable.
- Adding a visual indicator while waiting for the second party to connect would improve the user experience by offering a visual cue notifying them of the current status of the call and assuring them that a connection is indeed being attempted.
- To avoid excluding individuals without functioning cameras and/or microphones, we could update our database model to add employer phone numbers so that they may still contact the employer via phone. Another idea would be to display the employer phone number prominently onscreen if a call is started but no microphone is detected.

##Key Points

- We implemented video chat to provide a seamless opportunity for individuals who already face challenges to more easily find a place in the work force
- We intended to minimize the upfront information collected to lower the barrier to entry to applicants who may have difficulty filling out long applications. It is frustrating enough already for non-disabled individuals to fill out long applications, one after another, only to ultimately be rejected and have to repeat the process all over again.
- Our platform accounts for both those who wish to work remotely as well as those who wish to work in-house. While some individuals may be able to physically report to work, travel accommodations may be cumbersome and providing a seamless video interview platform reduces wasted time, energy, and frustration.

PATCH	/Jobs	Patch an existing model instance or insert a new one into the data source.
GET	/Jobs	Find all instances of the model matched by filter from the data source.
PUT	/Jobs	Replace an existing model instance or insert a new one into the data source.
POST	/Jobs	Create a new instance of the model and persist it into the data source.
PATCH	/Jobs/{id}	Patch attributes for a model instance and persist it into the data source.
GET	/Jobs/{id}	Find a model instance by {{id}} from the data source.
HEAD	/Jobs/{id}	Check whether a model instance exists in the data source.
PUT	/Jobs/{id}	Replace attributes for a model instance and persist it into the data source.
DELETE	/Jobs/{id}	Delete a model instance by {{id}} from the data source.
GET	/Jobs/{id}/exists	Check whether a model instance exists in the data source.
POST	/Jobs/{id}/replace	Replace attributes for a model instance and persist it into the data source.
GET	/Jobs/change-stream	Create a change stream.
POST	/Jobs/change-stream	Create a change stream.
GET	/Jobs/count	Count instances of the model matched by where from the data source.
GET	/Jobs/findOne	Find first instance of the model matched by filter from the data source.
POST	/Jobs/replaceOrCreate	Replace an existing model instance or insert a new one into the data source.
POST	/Jobs/update	Update instances of the model matched by {{where}} from the data source.
